WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, the total strength of the reporting units as shown herein has been consistently about four percent below the actual strength of the Army in the Continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatism other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" published in the ASF Monthly Progress Report; the latter include discharges for inaptness in addition to CDD's and are assembled on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station.

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 7 JULY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 7 July 1944 the admission rate from all causes and from all diseases combined remained substantially unchanged. The admission rate from all causes for this week was reported at 530 per thousand and the corresponding admission rate from disease at 459 per thousand. Both of these rates are about 25 percent lower than those for the corresponding week of 1943. Morbidity during the past two weeks has been not only the lowest recorded this year but also under the lowest experienced during 1942 or 1943.

Morbidity from injury was reported at 71 per thousand, a decrease for the second consecutive week from the relatively high rate of 78 per thousand registered during the week ending 23 June. Nonetheless, current morbidity from injury continues somewhat above the average rate for the year to date (69 per thousand).

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased for the twentieth consecutive week and was reported at only 67 per thousand or fractionally below the rate for the preceding week, and almost 40 percent under the rate for the corresponding week of 1943. The current admission rate is the lowest registered so far in World War II and is about 25 percent lower than the minimum rate recorded in 1943.

The admission rate from pneumonia, at 7 per thousand, was about the same as for the previous week. Current morbidity from this cause is about 40 percent lower than that for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) remained at 30 per thousand, which is about the same as the rate for the year to date. The admission rate for diarrhea and dysentery continued at 10 per thousand or 60 percent below the rate for the corresponding week of 1943.

The number of new cases of measles, mumps, and scarlet fever continued to decrease toward the seasonal lows to be expected during the late summer and early fall months. The number of new cases of meningitis decreased for the fourth consecutive week to reach the lowest figure since the week ending 8 October 1943. The number of new cases of rheumatic fever decreased by about 25 percent and was at the lowest level since the week ending 7 January 1944.

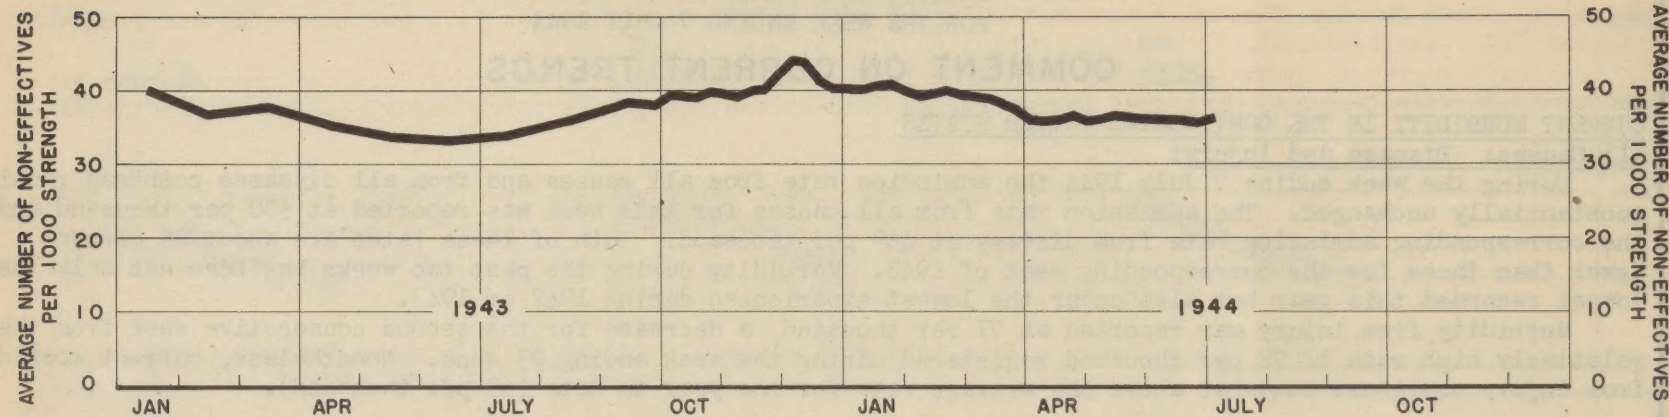

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease varied but little by Service Command. In the First and Ninth Service Commands morbidity from disease increased about 10 percent, while in the Military District of Washington and the Fifth Service Command the admission rates from disease decreased about 5 percent. The Second Service Command again reported the highest admission rate from all causes (591 per thousand) and from disease (519 per thousand).

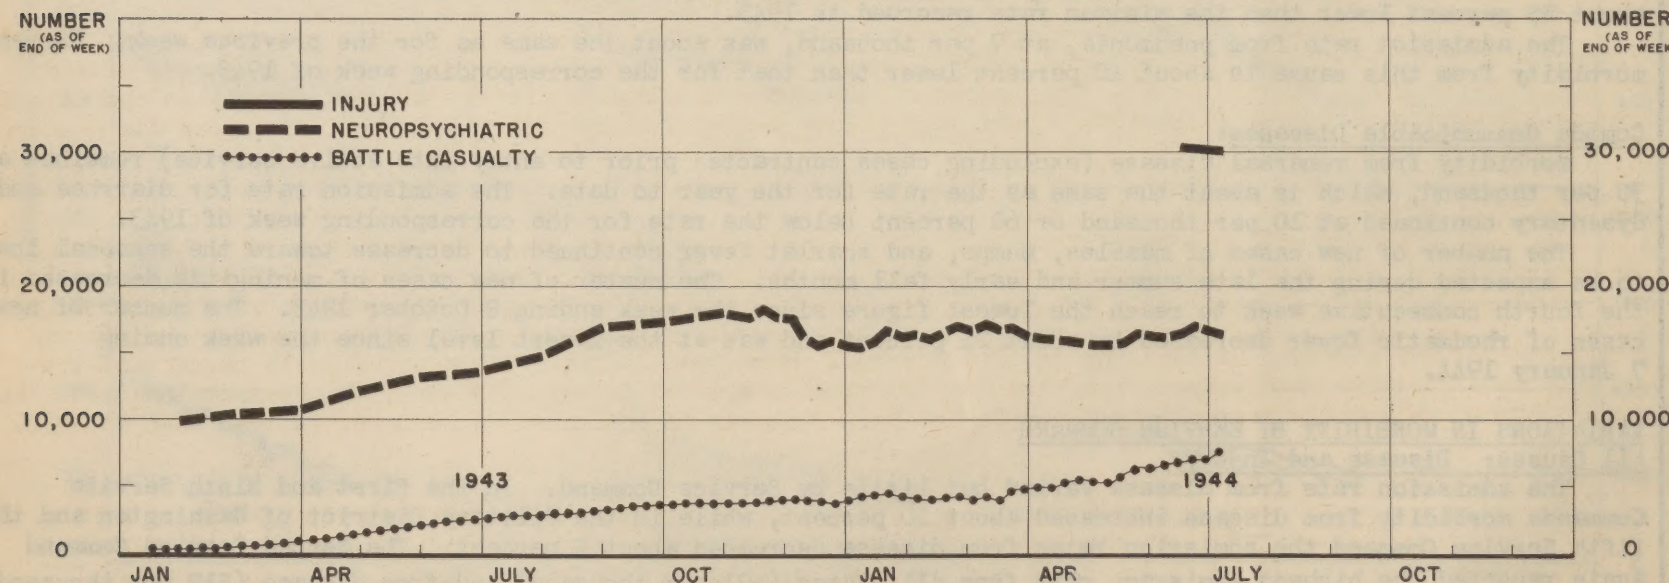

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

while the Sixth Service Command reported the lowest morbidity from all causes (472 per thousand) and from disease (424 per thousand).

A sharp increase in the admission rate from injury was reported by the Second Service Command. The Fifth and Ninth Service Commands continued to report the highest admission rates from injury (about 80 per thousand).

Respiratory Causes:

Most Service Commands reported substantially the same admission rates from colds, influenza, etc. Increases of 10 percent or more in morbidity from these causes occurred in the Military District of Washington and the Ninth Service Command, while a decrease of this magnitude was reported by the Third Service Command. The lowest admission rates from these causes were registered in the Third, Fourth, Fifth, and Sixth Service Commands, all of which reported rates of about 60 per thousand.

The highest morbidity from pneumonia continued to be reported by the Sixth Service Command (about 14 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases, decreased sharply in the First Service Command and the Military District of Washington. The Second and Fifth Service Commands continued to report the highest admission rates from these causes (in excess of 40 per thousand); the former experienced relatively high morbidity largely because of the higher incidence among task force troops not under its jurisdiction.

The highest morbidity from diarrhea and dysentery was reported by the Fifth Service Command (16 per thousand), while the Fourth and Eighth Service Commands were the only others to report admission rates in excess of the average for the total United States. The number of new cases of rheumatic fever declined sharply in the Seventh Service Command, and this accounted for almost all of the decrease in morbidity from this cause for the country as a whole.

NON-EFFECTIVE RATE:

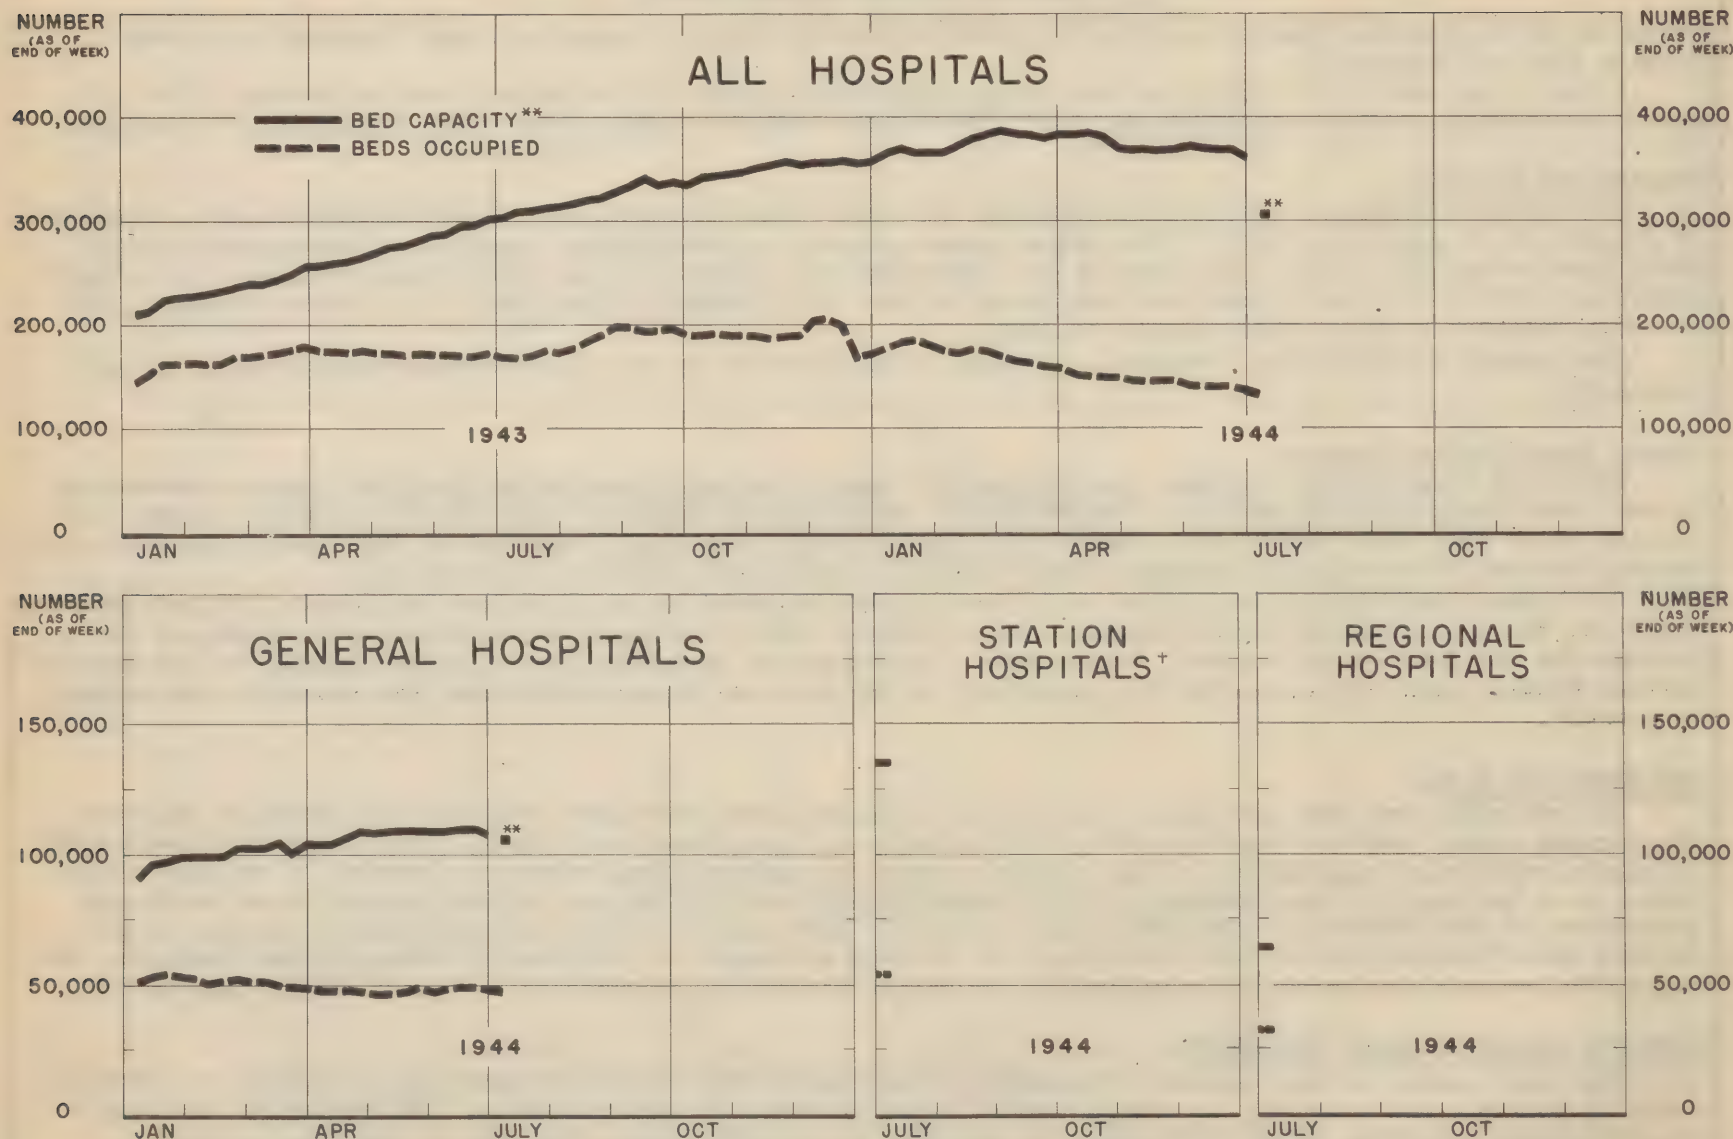

The non-effective rate increased from 35.6 per thousand (the lowest rate recorded this year) to 36.2 for the current week. Despite lower morbidity which results in less non-effectiveness, the non-effective rate tends to remain relatively high because of the steady movement of evacuees from abroad and because of the decreasing strength of the Army in this country; both of these factors tend to make the patients remaining an increasing proportion of the strength of the Army in this country. More than 10 percent and possibly 15 percent of the current non-effective rate arises from time lost by cases evacuated to this country from overseas theaters. The non-effective rate for personnel stationed in the United States is estimated to be lower in 1944 than in 1943.

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week was equivalent to a rate of about 36 per thousand strength, as compared with 35 per thousand the previous week. The number of neuropsychiatric cases remaining as of 7 July 1944 was reported at 16,247 or about the same as the previous week.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

**AFTER JUNE 1944 DATA ARE FOR AUTHORIZED BEDS

† ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

ARMY SERVICE FORCES, OFFICE OF THE SURGEON GENERAL
MEDICAL STATISTICS DIVISION, HEALTH REPORTS BRANCH

COMMENT ON CURRENT TRENDS (CONT'D)

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 7 July 1944 totaled about 30,000 while the number of battle casualty patients remaining increased to 7,664. All but 150 of the latter were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 7 July 1944 the total number of enlisted men discharged by CDD was 2974. About one-half of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

In this report hospitalization data are for the first time presented in terms of authorized beds rather than in terms of bed capacity. (For definitions of beds authorized see Paragraph 36 h of AR 40-1080 C 2.) In a few instances where stations have not reported the number of authorized beds, the figures presented in this report are those for the reported total bed capacity. It should be noted that the total authorized beds may equal but cannot exceed the total bed capacity, and as a rule the former will be lower than the latter.

The total authorized beds as of 7 July 1944 numbered about 305,000; this compares with a figure of about 360,000 for total bed capacity as of the end of the previous week. The total number of beds occupied was 134,000 (or 44 percent of the total beds authorized) which was about 2,000 less than at the end of the previous week. Included in the total authorized beds were 295 T/O hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 106,000 (as compared with a reported total bed capacity of 107,000 as of the end of the previous week). The total beds occupied in General Hospitals were about 48,000 (or about 45 percent of the authorized beds) which was about the same as at the end of the previous week.

Station hospitals (as distinct from Regional Hospitals) reported 134,000 total authorized beds, while the Regional Hospitals reported about 64,000 beds. The number of beds occupied at station hospitals was about 54,000 or about 40 percent of the total beds authorized. The beds occupied at Regional Hospitals numbered 32,000 or 50 percent of the total authorized beds.

As of 7 July 1944 the bed capacity of convalescent facilities in General Hospitals was 15,150 which was an increase of about 600 as compared with the previous week. The total beds occupied in such convalescent facilities continued at about 4,500, which was 30 percent of the total bed capacity.

FORM 56-902-8 July 1944

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 30 JUNE 1944

PRISONERS OF WAR

During the five week period ending 30 June 1944, the admission rate from all causes among prisoners of war was at a rate of 658 per year per thousand strength. This rate is about 20 percent higher than that for U.S. troops in the continental United States during the same period. Morbidity from all diseases combined for prisoners of war was about 530 per thousand or slightly above that for U.S. troops, while the admission rate for injury was 125 per thousand or approximately 80 percent higher than for U.S. troops in this country.

During April and May many Italian prisoners of war were transferred to Italian Service Units. Data from all such Service Units were not received during that time; those received were included with Italian prisoners of war. In this report distinction is made between Italian prisoners of war and Italian Service Units, which are now required to submit separate reports. In the total figures for all prisoners of war combined, Italian Service Units are included.

Beginning with this report individual listing of prisoner of war camps will be limited to those with 500 or more strength since admission rates calculated for small exposures are not reliable or significant. Accordingly, except for Japanese prisoners, data for all camps with less than 500 mean strength have been combined.

Italian Service Units experienced considerably higher morbidity than either German or Italian prisoners. Thus, the disease admission rate for Italian Service Units was more than 20 percent higher than for German prisoners and almost double that for Italian prisoners. Morbidity from injury among German

prisoners continued to be significantly higher (about double) than for Italians with the Italian Service Units having a somewhat higher admission rate than the Italian prisoners. It is noteworthy that the injury admission rate for Italian prisoners for the first time exceeded 50 per thousand; the rate for Italian Service Units approximates very closely that for U.S. troops in this country.

Morbidity from colds, influenza, etc. among prisoners of war at a rate of 58 per thousand or almost the same as during the previous month. The experience among prisoners of war continued to be well below that for U.S. troops for whom current morbidity is at a rate of about 75 per thousand. As in previous months, morbidity from these causes was higher for Italians than for Germans, the respective admission rates being 122 per thousand for Italian Service Units, 40 per thousand for Italian prisoners, and 45 per thousand for German prisoners.

During June morbidity from malaria (representing predominantly cases presumably acquired outside the United States) was at a rate of 81 per thousand or somewhat below the corresponding rate of 89 per thousand in May and the record high rate of 94 in April. The number of cases of malaria reported as being presumably acquired in the United States increased to 31 which is the highest number so far recorded.

The admission rate for diarrhea and dysentery was 11 per thousand, being a relatively sharp seasonal increase from 2 per thousand for the previous month. The new cases of the other communicable disease considered in the following tables were relatively few and the corresponding rates of admission were low.

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 30 JUNE 1944

PRISONERS OF WAR (CONT'D)

The camps reporting the highest morbidity from disease were Clinton, Miss. (G), Camp Breckinridge, Ky. (G), Camp White, Oreg. (G) and Camp Kilmer, N.J. (ISU) all of which had rates of more than 1400 per thousand. Clinton, Miss. (G) and Camp Gruber, Okla. (G) both had admission rates from injury in excess of 300 per thousand for the sixth consecutive month. In addition high morbidity from injury was also reported by the following: Camp Rucker, Ala. (G), Camp Claiborne, La. (G), Camp Fannin, Texas (G), Camp Hood, Texas (G), Camp Beale, Calif. (G) and Ft. Lewis, Wash. (G).

The number of prisoners of war remaining under treatment in hospital at prisoner of war camps as of the end of June and the corresponding rate per thousand strength are shown below. The total number of prisoner patients at the end of June was about 15 percent higher than as of the end of May; increases occurred for all classes of prisoners. In addition to the prisoners remaining under treatment in hospital at the prisoner of war camps as shown below, there were 1152 remaining under treatment in other hospitals; of these 1054 were in General Hospitals.

	<u>Number Remaining</u>	<u>Prisoner Patients Remaining per 1000 Strength</u>
German	2476	19
Italian Prisoners	153	10
Italian Service Units	507	15
Japanese	6	14

SUPPLEMENTARY HEALTH REPORT ON WAC

FOR THE FIVE WEEK PERIOD ENDING 30 JUNE 1944

During the five week period ending 30 June 1944, the annual rate of admission from all causes combined among WAC personnel at 32 selected stations was about 900 per year per thousand strength. This was about 20 percent lower than in May; most of the decrease was due to the corresponding decline in the admission rate from colds, influenza, etc. The June admission rate from all causes for the WAC was about 65 percent higher than for the total Army in the continental United States (about 550 per thousand).

Morbidity from all causes varied considerably by station. The admission rate at most stations was between 500 and 800 per thousand, but there were a number with rates in excess of 1000 per thousand. The highest rates were reported from Drew Field (6189 per thousand), Ft. Bragg (2084 per thousand) and Ft. Jackson (1936 per thousand). It is noteworthy that these three stations reported approximately the same high rates in May as in June. An explanation and verification of the extremely high rate for Drew Field has been requested.

The two largest stations, Ft. Oglethorpe and Ft. Des Moines, (which account for almost 45 percent of the total strength of the 32 selected stations) experienced for the first time about the same morbidity as the other 30 stations. These two large stations which are predominately training centers had in previous months reported considerably higher admission rates than the other stations. The decline in morbidity in June for all of the 32 stations reporting was entirely due to the decreases in morbidity at Ft. Oglethorpe and Ft. Des Moines; for the other 30 stations morbidity was slightly higher in June than in May.

Morbidity from colds, influenza, etc. among the WAC decreased from a rate of 219 per thousand for May to 96 per thousand for June. Despite this considerable drop the June rate for the WAC was about 20 percent in excess of the rate for the total Army in the continental United States. However, this differential is relatively small as compared with previous months, when morbidity from these causes among the WAC ran about twice as high as that for the total Army.

Morbidity from diarrhea and dysentery among the WAC was at the relatively high level of 27 per thousand in contrast with a rate of about 10 per thousand for the total Army; the high rate for the WAC largely reflected a single outbreak at Ft. Oglethorpe which accounted for about two-thirds of the total cases.

Neuropsychiatric disorders accounted for an annual admission rate of 38 per thousand or considerably above the corresponding figure for the total Army. Morbidity from other communicable diseases shown in the following tables was at a relatively low level.

As of 30 June 1944 there were 518 WAC patients remaining in hospital and quarters at these stations or about 10 percent less than the corresponding number at the end of the previous month. In addition to the 474 WAC's remaining in hospital at the selected stations there were 377 WAC's occupying beds in General Hospitals (exclusive of Walter Reed General Hospital which is one of the selected stations).

The number of WAC patients in hospital on 30 June represented a rate of 20 per thousand strength or slightly lower than the rate for the total Army in the U.S. exclusive of patients in General Hospitals.
